

$$y = mx + b \quad mx - y + b = 0$$

Lesson 4 – General Form $Ax + By + C = 0$

x-intercept- the x coordinate of the point when a line or curve crosses the x-axis; the value of x when $y=0$.
y-intercept – the y coordinate of the point when a line or curve crosses the y-axis; the value of y when $x=0$

Example 1:

For the linear equation $2x + 3y - 12 = 0$,

a) state the x-intercept $(x, 0) \quad y = 0$

$$2x + 3(0) - 12 = 0$$

$$2x - 12 = 0 \quad +12 \quad +12 \quad \frac{2x}{2} = \frac{12}{2} \quad x = 6$$

Therefore, the coordinates for the x-intercept is $(6, 0)$

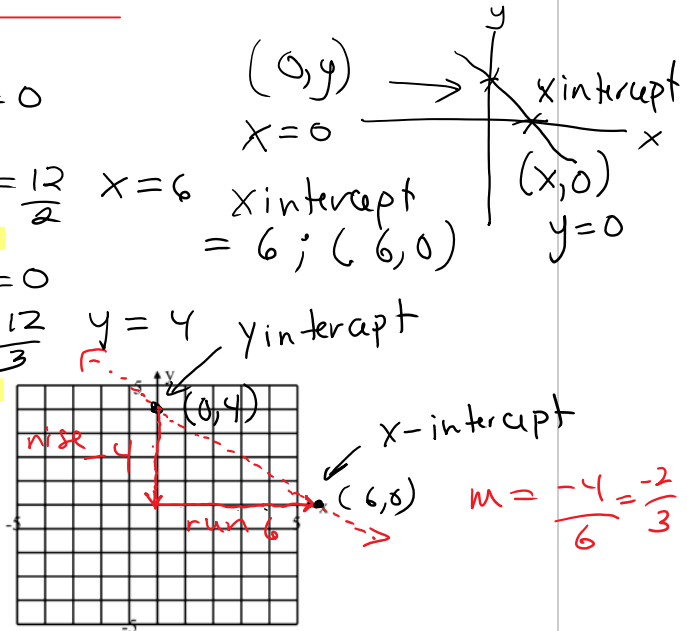

b) state the y-intercept $(0, y) \quad x = 0$

$$2(0) + 3y - 12 = 0$$

$$3y - 12 = 0 \quad +12 \quad +12 \quad \frac{3y}{3} = \frac{12}{3} \quad y = 4 \quad \text{y intercept}$$

Therefore, the coordinates for the y-intercept is $(0, 4)$

c) use the intercepts to graph the line.

d) What is the slope of this graph?

$$m = \frac{\Delta y}{\Delta x} = \frac{4 - 0}{0 - 6} = \frac{4}{-6} = -\frac{2}{3}$$

e) Determine the equation of the line using slope-intercept form, that is, $y = mx + b$

$$y = -\frac{2}{3}x + 4$$

$y = 4$
or b

Example 2:

Change the equation from standard form $2x + 3y - 12 = 0$ to slope-intercept form algebraically.

$$Ax + by + c = 0 \rightarrow y = mx + b$$

$$2x + 3y - 12 = 0$$

$$-2x + 12 + 3y = 0$$

$$3y = -2x + 12$$

$$y = -\frac{2}{3}x + 4$$

$$Ax + By + C = 0 - C$$

$$-Ax + By = -C - Ax$$

$$\frac{By}{B} = \frac{-Ax}{B} - \frac{C}{B}$$

$$y = -\frac{A}{B}x - \frac{C}{B}$$

$$2x + 3y - 12 = 0$$

$$A = 2 \quad B = 3 \quad C = -12$$

$$m = -\frac{(2)}{3} = -\frac{2}{3} \quad \left(\frac{-A}{B} \right)$$

$$b = \frac{-(-12)}{3} = 4 \quad \left(\frac{-C}{B} \right)$$

$$y = mx + b$$

y intercept

$$m = -\frac{A}{B} \quad b = -\frac{C}{B}$$

$$y = -\frac{2}{3}x + 4$$

$$b = \frac{3}{-(-12)} \\ = \frac{12}{3} = 4$$

$$\left(\frac{C}{B} \right)$$

$$y = -\frac{2}{3}x + 4$$

Example 3:

Parents of the cheerleading squad rent a hall. They arrange a talent show as a fundraiser. The relationship between the number of tickets sold, x , and the profit, y , in dollars, may be represented by the equation $24x - 2y - 1680 = 0$.

- a) What is the slope of the line?
- b) Identify the y-intercept.
- c) How many tickets must the parents sell to reach the break-even point.

$$a) (24)x - 2y - 1680 = 0 \rightarrow y = mx + b$$

$$\begin{aligned} -24x & -2y - 1680 = 0 && a) m = \frac{-A}{B} && b) b = -C \\ -24x & + 1680 - 2y && = -24 && b = -1(-1680) \\ -2y & = -24x + 1680 && m = 12 && b = \frac{1680}{-2} \\ y & = 12x - 840 && && \end{aligned}$$

Example 4:

Rewrite the equation each in general form, $Ax + By + C = 0$. What is the x and y intercepts of these lines?

a) $y = -\frac{2}{3}x - 6$ y intercept = -6

b) $y = \frac{3}{4}x - 2$ y intercept = -2

c) $y = 12x - 840$ y = profit

$$0 = 12x - 840 + 840 \quad y = 0$$

$$\frac{840}{12} = \frac{12x}{12} \quad x = 70$$

must sell 70 tickets to break even.

Special Cases of the equation $Ax + By + C = 0$, when one or more of A, B, C are 0.

- $Ax + By = 0$ is a line that passes through the origin (0,0)
- $By + C = 0$ is a horizontal line.
- $Ax + C = 0$ is a vertical line.

Example 5:

Describe each of the following lines. Identify the intercepts, then state the domain and range.

a) $x - y = 0$ y = 0 x = 0

b) $2y + 4 = 0$ missing x term goes through origin

c) $3x - 12 = 0$ missing y term

$\frac{3x}{3} = \frac{12}{3}$ $x = 4$ m = undefined vertical line

- a) $D: x \in \mathbb{R}$
 $R: y \in \mathbb{R}$
- b) $D: x \in \mathbb{R}$
 $R: y = -2$
- c) $D: x = 4$
 $R: y \in \mathbb{R}$

Example 6:

Brook wants to save \$336 to decorate her bedroom. She has two part-time jobs. On weekends, she works as a snowboard instructor and earns \$12 per hour. On weeknights, she earns \$16 per hour working as a high-school tutor.

- a) Write an equation to represent the number of ^{hours} Brooke needs to work as a snowboard instructor, S , and as a tutor, T .

$\# h = \text{rate}$ $\$12/h \rightarrow S$ $\$16/h T$ $\text{Earnings} + \text{Earnings}$
 $12S + 16T = 336$

- b) What is the S-intercept of a graph of the equation? What does the S-intercept represent?

$T=0$ $12S + 16T = 336$ $28 \text{ hours would be required as a snowboard instructor if Brook does not tutor.}$
 $\frac{12S}{12} = \frac{336}{12}$
 $S = 28$

- c) What would the T-intercept be? What does it represent?

$S=0$ $12(0) + 16T = 336$ $21 \text{ hours worked as a tutor without snowboard instructing earns } \$336.$
 $\frac{16T}{16} = \frac{336}{16}$
 $T = 21$

- d) Suppose Brooke works 8h as a snowboard instructor. How many hours will she need to work as a tutor?

$S=8$ $12S + 16T = 336$
 $T = \# \text{ of tutor hours.}$ $12(8) + 16T = 336$
 $96 + 16T = 336$
 $\begin{array}{r} 96 \\ -96 \\ \hline 16T = 240 \\ \frac{16T}{16} = \frac{240}{16} \\ T = 15 \end{array}$

Brook will need to work 15 hours as a tutor if she instructs boarding for 8 hours.
